                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A. Accession: A 192895
A. Molecule type: protein
C. Comment: The protein consists of two chains, A and B, held together by disulfide bonds
C. Comment: Tissue kallikreins cleave Met-Lys and Arg-Ser bonds in kininogen to release I
C. Superfamily: trypsin, trypsin homology
C. Superfamily: trypsin homology of the protein and trypsin homology of the protein A **Status experimental of the protein and trypsin homology of the protein A **Status experimental of the protein and the protein and the protein the protein the protein and the protein the pro

C. Comment: The match of the programment of the teroclamers, the two chains
C. Comment: Haptoglobin is a plasma glycoprotein; haptoglobin forms a complex with ham
C. Superfamily: haptoglobin: complement factor H repeat homology; trypsin homology
F. 1-83/Product: haptoglobin alpha chain #status experimental ALP>
F. 15-68/Domain: complement factor H repeat homology <FH2>
F. 15-532/Product: haptoglobin beta chain #status experimental ABET>
F. 15-68/Domain: trypsin homology <FRY>
F. 19-107, 214/Aminding site: carbohydrate (Asn) (covalent) #status experimental
F. 34-68, 72-189, 232-263, 274-304/Disulfide bonds: #status experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     2; Length 282;

Can. J. Biochem. 51, 249-264, 1973

A; Title: Studies on the interchain disulfides of human haptoglobins.

A; Feference number: A90747; MUID:73166302

A; Contents: annotation; disulfide bonds in alpha chain

C; Comment: The sequence of the 1S variant is shown. There is a separate entry for hag C; Comment: The mature haptoglobin molecule is a dimer of heterodimers, the two chain: C; Comment: Each haptoglobin beta chain can bind an alpha-beta heterodimer of hemoglot C; Comment: The haptoglobin-hemoglobin complex is degraded in the liver (where haptoglobin that results from its binding to hemoglobin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A Map position: 16922.2-16922.2

C.Superfamily: haptoglobin; complement factor H repeat homology; trypsin homology

C.Keywords: acute phase; duplication; glycoprotein; hemoglobin binding; heterotetramer;

F.118/Domain: sjgnal sequence #status predicted (SIG)

F.19-160/Product: haptoglobin allele 2 alpha chain #status experimental (ACH)

F.33-86/Domain: complement factor H repeat homology #status atypical (FH2)

F.162-406/Product: haptoglobin beta chain #status predicted (BCH)

F.162-399/Domain: trypsin homology (TRY)

F.162-399/Domain: trypsin homology (TRY)

F.162-80/Disulfide bonds: interchain #status experimental

F.52-86.111-145/Disulfide bonds: #status experimental

F.184,207,211,241/Binding site: carbohydrate (Asn) (covalent) #status predicted

         The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymersae chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in
                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to human tumour antigen-derived gene 15 (TADG-15) protein and coding sequence (see AAH23601 and AAB98500).
AMGG-15 is an extracellular serine protease. It was found that TADG-15 is over-expressed in ovarian tumours. TADG-15 protein or its fragments of 9-20 residues that lack TADG-15 protease activity are useful for vaccinating an individual against TADG-15, having, suspected of having or at risk of getting cancer. Furthermore, the TADG-15 gene can be used as a diagnostic or therapeutic target in cancer. The present sequence was used in a sequence homology alignment with the catalytic domain of TADG-15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel extracellular serine protease, termed tumor antigen-derived gene

the processing or clearance of amyloid precursor protein to form
beta-amyloid peptide. Its amino acid sequence was deduced from
a cDNA clone (AAT397981) obtd. from a human lung library. Recombinant
protease can be produced in transformed or transfected prokaryotic
(partic. E. coli) or eukaryotic (partic. AV-120 host cells. It is
used to develop products for the design and testing of cpds. useful
for treating or preventing conditions associated with beta-amyloid
peptide, esp. Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; KLK-L1; KLK-L2; KLK-L3; KLK-L4; KLK-L5; KLK-L6; HSCBE;

                                                                                                     The present sequence is human stratum corneum chymotryptic enzyne (HSCEE), a member of the kallikrein multi-gene family. Kallikreins and kallikrein-like proteins are a subgroup of the serine protease enzyme family. They catalyse the selective cleavage of specific polypeptide precursors to release peptides with potent biological activity. Nucleic acids encoding kallikrein-like proteins KLK-L1, KLK-L2, KLK-L3, KLK-L4, KLK-L5 and KLK-L6 have been isolated. The proteins are useful in the treatment, monitoring and diagnosis of cancers, especially prostrate cancer. They can also be used to identify a substance that can associate with or mediate the biological activity of the proteins. Antibodies on be used to treat conditions mediated by the kallikrein-like proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastabls, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cancer; ovarian; breast; lung; colon; prostate; carcinoma; human; antisense therapy; malignant hyperplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human stratum corneum chymotrypsin enzyme peptide #20 (residues 59-67).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence is human factor D. Factor D is a highly specific serine protease essential for activation of the alternative complement pathway. The protease essential for activation of the alternative complement pathway. The plasma concentration of factor in humans is very low making it a activation of the alternative complement pathway. Factor D is used to generate inhibitors of complement activation which bind factor D at a molar ratio of at least 1.5:1 and less than 80:1 (inhibitor:factor D). Factor D was used to design a monoclonal antibody MAD 166-32 which binds to factor D and blocks its ability to activate complement. The arti-factor D molecules can function to inhibit in vivo complement activation and/or the alternative complement pathway and inflammatory activation and/or the alternative complement pathway and inflammatory activation and/or the alternative complement activation of macrophages, neutrophils, platelets, and mast cells, oedema, and tissue damage. The inhibitors of complement activation may be used to treat diseases or conditions that are mediated by excessive or uncontrolled activation of the complement system. These inhibitors are also canditions associated with excessive or uncontrolled activation of the complement systems include tissue damage due to ischaemia-reperfusion following act my montrolled crivation of the complement systems include tissue damage due to ischaemia-reperfusion following act my montrolled crivation of the complement systems include tissue damage due to ischaemia-reperfusion following act my montrolled septic shock, haemodiallysis, severe asthma, crown's disease, transplant readed with as experient of number of the complement of the complement systems include septic shock, haemodiallysis, severe asthma, crown's disease, transplant readed with as experient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         multiple sclerosis. The anti-factor D molecules can also be used diagnostically to determine the presence of or quantity of factor D in tissue specimen or a body fluid sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      treated such as systemic lupus erythematosus, Alzheimer's disease and

aminopopulase and cystellogouse proteins (1). Also described is a method for identifying a compound (II) capable of inhibiting flea protease activity comprising: (a) contacting (I) with a protease stivity in the absence of the compound, where (I) has proteadly compound inhibits protease activity by detecting cleavage of the protease substrates; where decreased cleavage of the protease substrates inhibitory compound. (I), nucleic acid molecules encoding indicates an inhibitory compound. (I), nucleic acid molecules encoding (I), and antibodies immunospecific for (I) and (II) are useful for preventing and reducing flea infestations, particularly the species (I), and antibodies immunospecific for (I) and (II) are useful for preventing and reducing flea infestations, particularly the species (I), and infestations, particularly the species of the corporabilities and infestation by other ectoparasites, preferably caseful for reducing infestation by other ectoparasites, preferably mosquitces, midges, sandfiles, blackfiles, ticks and Rhodnius. AAC90818 to AAC90913 and AAB50551 to AAB50644 represent sequences used in the

                                                                                                                                                                                                                                                                                                                                                                                                             This sequence, PfSP17, represents an N-terminal fragment of serine protease PfSP4..isolated from a flea cDNA library by homology with conserved serine protease sequences. Other N-terminal sequences are given in AAMO1187. WOL178 and WOL182. The sequence forms part of full-length sequence PfSP4-223 (AAMO1165), which also contains the sequence PfSP4-52 (AAMO1169). The peptide may be used in a vaccine for protection of domestic animals from flea infestation, or in isolation of protease-inhibitors, which may be used in controlled release formulations to reduce the flea burden on and around the animal. The inhibitors may be included in insecticidal compositions to increase efficacy of other active agents, by reducing proteolytic activity in the flea midgut.

This sequence (PFSP4-223) represents a flea midgut serine protease encoded by the nfSP4-672 gene, isolated from a flea cDNA library by homology with conserved serine proteases sequences (e.g. AAW01226). Although the entire sequence is not highly conserved to that of a conserved to that of a conserved to that of a conserved sequence, and conserved Asp and Cys residues. The sequence contains sequence, and conserved Asp and Cys residues. The sequence contains sequence accive is the His and Ser regions, a conserved Serine protease AAW01169 (PFSP4-52), which spans 2 conserved serine protease acquences AAW01182, and a sequence similar to part of AAW01187. The protein shows homology to an Anopheles gambiae chymotrypsin-I precursor. The protein may be used in a vaccine for protection of domestic animals from flea infestation, or in isolation of protease-inhibitors, which may be used in controlled release formulations to reduce the flea may be used in controlled release formulations to reduce the flea insecticidal compositions to increase efficacy of other active capents, by reducing proteolytic activity in the flea midgut.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA encoding Flea serine protease and aminopeptidase \dot{} useful in vaccines to protect animals from flea infestation.

                                                                                                                                                                                                                                        Peptide
                                                                                                                                                                                                                                                                                                Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Peptide
PART OF THE PART O
```

```
The present invention describes isolated flea serine protease,
aminopeptidase and cysteine protease proteins (I). Also described is a
method for identifying a compound (II) capable of inhibiting flea
protease activity comprising: (a) contacting (I) with a protease
substrate and a putative inhibitory compound, where (I) has proteolytic
activity in the absence of the compound; and (b) determining if the
compound inhibits protease activity by detecting cleavage of the
compound inhibits protease activity by detecting cleavage of the
protease substrates; where decreased cleavage of the protease substrate
indicates an inhibitory compound. (I), nucleic acid molecules encoding
(I), and antibodies immunospecific for (I) and (II) are useful for
preventing and reducing flea infestations, particularly the species
ctenocephalides felis (cat fleas), Ctenocephalides canis (dog fleas)
useful for reducing infestation by other ectoparasites, preferably
mosquitoes, midges, sandflies, blackflies, ticks and Rhodnius. AAC90818
constitutions in an ABBSOSII to AABSOGSII to AABSOGSII to AABSOGSII exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

```
AAW10694 is a recombinantly produced human neuropsin protein. The main invention relates to an antibody against the neuropsin protein, in particular a claimed fragment of the neuropsin protein (see AAW10695 and features table). The antibody can be used to treat neurodegenerative disorders such as Alzheimer's disease and epilepsy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mouse; neuropsin; hippocampus; lambda gt10; primer; PCR; amplification; polymerase chain reaction; serine protease domain; nerve growth factor; NGF; insect cell; virus; expression vector; transfection; cerebral disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This polypeptide comprises the loop regions in the vicinity of the putative substrate binding site of kallikrein. The crystallographic structure of this region was used as a template structure to model the structure of the substrate-binding pocket of mouse mast cell protease 7 (mMCP-7, see AAM64233). The invention relates to mMCP-7 and related tryptase-7 proteases that can be used to prevent or inhibit fibrin clot formation. Such proteases can be used to treat disorders mediated by undesirable thrombus clot formation such as myocardial infarction and reocclusion following angioplasty of blood clots associated with pulmonary thromboembolism, deep vein thrombosis, cerebral embolism, renal vein and peripheral arterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New compositions containing tryptase-7, e.g. mouse mast cell protease-7 - are used to treat clot formation in e.g. myocardial infarction, reocclusion following angioplasty or pulmonary thromboembolism
                                                                                                                                                                                                                                                                                MCP-7; mast cell protease 7; tryptase-7; serine protease; human; kallikrein; blood clot; anticoagulant; myocardial infarction; reocclusion; thromboembolism; cerebral embolism; thrombosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

```
serine protease, designated Salmonase. The DNA sequence was isolated from a c DNA library constructed from nucleic acid isolated from the venom gland of a Korean viper Salmosa (Agkistrodon halys brevicaudus). Salmonase protein comprises two subunits, and has a molecular weight of about 26 kD and an isoelectric point of 5.04. Salmonase is useful
                                                  Salmonase, a direct-acting fibrinolytic serine protease - encoded by cDNA from snake venom gland library
                                                                                                                                  The present sequence represents a novel direct-acting fibrinolytic
                                                                                                                                                                                                                                                                                             Score 37; DB Pred.                                                                                                                                                                                                                                                                          neuropsin. The encoding gene was isolated from a mouse hippocampal cDNA library in lambda gilo using a cloned, amplified fragment of the gene (clone B41; AAT63254). This fragment was amplified using primers AAT63252-3. The primers were synthesised based on the serine protease domain of nerve growth factor (NGF)-gamma. The screen isolated 6 positive clones, of which clone NP5 contained the longest insert (this sequence). The protein has a molecular weight of acund 26 kD. It has 43% homology with EGF-BP, 41 % with NGF-gamma, 39% with NGF-alpha; 38% with trypsin and 18% with tPA. The protein can be used for clinical diagnosis and treatment of cerebral diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is the protein sequence for fibrinolytic enzyme, brevinase, which is separated from the poison of Agkistordon blomhoffi brevicaudus (mamushi). The enzyme shows stability at high temperatures and is thus useful in developing thrombolytic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention i useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176 ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Flea; Siphonaptera; protease; vaccine; prophylaxis; infestation; immunoglobulin protease; larvae; host animal.
                                                                                                                                                                                                                                                                                                                                 developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a novel flea serine protease. The protease, its mimetopes, antibodies (Ab) and inhibitors of the protease, its mimetopes, antibodies (Ab) and inhibitors of the protease, its mimetopes, antibodies (Ab) and inhibitors of the protease as the DNA encoding the protease activity (especially immunoglobulin protease) and so reduce flea infestation, especially immunoglobulin protease) and so reduce flea infestation, especially in cats or dogs. Alternatively, flea larvae may ingest the faces of adult fleas which comprises anti-protease antibodies produced by a host animal in response to administration of the protein. Therapeutic compositions may further comprise a compound that reduces haematophagous ectoparasite burden by a method other than by reducing flea immunoglobulin protease activity. The novel flea DNA encoding the protein can also used to produce recombinant protein, and fragments of it are used as probes and primers for identification and isolation of related sequences, also as primers for identification and isolation of related sequences, also as yorthesis of the protein. Ab are also useful for screening expression libraries, to purify the protein and to target cytotoxins to fleas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New flea protease genes and proteins - used in vaccine compositions for the prophylaxis and treatment of flea infestation, especially in cats or dogs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Flea; Siphonaptera; protease; vaccine; prophylaxis; infestation; immunoglobulin protease; larvae; host animal.

```
The present sequence represents a novel flea serine protease. The protease, its mimetopes, antibodies (Ab) and inhibitors of the protease, its mimetopes, antibodies (Ab) and inhibitors of the protease, as the DNA encoding the protein, may all be used in therapeutic compositions to reduce flea protease activity (especially immunoglobulin protease) and so reduce flea infestation, especially immunoglobulin protease antibodies produced by a host animal in response to administration of the protein. Therapeutic compositions may further comprise a compound that reduces haematophagous ectoparasite burden by a method other than by reducing flea immunoglobulin protease activity. The novel flea DNA encoding the protein can also used to produce recombinant protein, and fragments of it are used as probes and primers for identification and isolation of related sequences, also as primers. Computing agents and ribozymes for inhibition of the synthesis of the protein and to target cytotoxins to fleas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; protease; trypsin-like serine protease; enteropeptidase; acrosin;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a novel flea serine protease. The protease, its mimetopes, antibodies (Ab) and inhibitors of the protease, its mimetopes, antibodies (Ab) and inhibitors of the protease well as the DNA encoding the protein, may all be used in therapeutic compositions to reduce flea infestation, especially in cats or dogs. Alternatively, flea larvae may ingest the faces of adult fleas which comprises anti-protease antibodies produced by a host animal in response to administration of the protein. Therapeutic compositions may further comprise a compound that reduces haematophagous ectoparasite burden by a method other than by reducing flea immunoglobulin protease activity. The novel flea DNA encoding the protein can also used to produce recombinant protein, and fragments of it are used as probes and primers for identification and isolation of related sequences, also as primers, triplex-forming agents and ribozymes for inhibition of the synthesis of the protein and to target cytotoxins to fleas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                The sequence represents a human protein which shares structural similarity with mammalian proteases, particularly trypsin-like serine proteases such as enteropeptidase, plasminogen and arcosin. Proteases cleave protein substrates as part of degradation, maturation and secretory pathways within the body, and are associated with regulating development, modulating cellular processes, fertility and infectious diseases. Hence the new proteins and their associated nucleic acids are useful for drug screening, identification of nucleotide constructs for gene therapy and treatment of mental, biological and medical disorders. The sequences can be used to identify mutations associated with particular diseases, which may subsequently be used in diagnostic and prognostic assays.

The sequence represents a human protein which shares structural similarity with mammalian proteases, particularly trypsin-like serine proteases such as enteropeptidase, plasminogen and acrosin. Proteases cleave protein substrates as part of degradation, maturation and secretory pathways within the body, and are associated with regulating development, modulating cellular processes, fertility and infectious riseases. Hence the new proteins and their associated with regularing useful for drug screening, identification of nucleotide constructs for gene therapy and treatment of mental, biological and medical disorders. The sequences can be used to identify mutations associated with particular diseases, which may subsequently be used in diagnostic and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     promoter;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is one of four alternatively spliced kallikrein-like proteins encoded by the human KLK-L4 gene. Kallikreins and kallikrein-like proteins are a subgroup of the serine protease enzyme family. They catalyse the selective cleavage of specific polypeptide precursors to release peptides with potent biological activity. Nucleic acids encoding kallikrein-like proteins KLK-L1, KLK-L2, KLK-L3, KLK-L4, KLK-L5 and KLK-L6 have been isolated. The proteins are useful in the treatment, monitoring and diagnosis of cancers, especially prostrate cancer. They can also be used to identify a substance that can associate with or mediate the biological activity of the proteins. Antibodies can be used to treat conditions mediated by the kallikrein-like proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

                                                            The present sequence is a secreted protein from cDNA clone HKAFV61 which is obtained from human keratinocyte tissue cDNA library. The protein is a member of serine protease family and shows a high degree of sequence similarity to Mus musculus neuropsin. The protein, its coding sequence and its inhibitors are used in the diagnosis and treatment of disorders related to abnormal level of the protein or mutation in the nucleotide sequence. The serine protease is used to develop antagonists and fusion proteins. The fusion of this protein to His-tag, HA-tag, igg domains, etc. facilitates purification, fusion to IgG-1, IgG-3 and albumin increases the half life time in vivo, etc. The inhibitors and antagonists of serine protease can be used for treating disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        system, etc. The nucleotide and protein sequences can also be used to differentiate, proliferate and attract cells leading to regeneration of

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques for restore normal activity of (II) or to treat disease states involving companitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disouplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disources have applications in the polypeptide and polynucleotide sequences have applications in conditions in the prince of an anino acid sequences. ABG00010-ABG30377 represent novel human condition, but was obtained in electronic format directly from MPPO specification, but was obtained in electronic format directly from MPPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                         Human; chromosome mapping; gene mapping; gene therapy; forensic

Kallikreins and proteins are a subgroup of the serine protease enzyme family. They catalyse the selective cleavage of specific polypeptide precursors to release peptides with potent biological activity. Nucleic acids encoding kallikrein-like proteins KLK-L1, KLK-L2, KLK-L3, KLK-L3, KLK-L4, KLK-L5 and KLK-L6 have been isolated. The proteins are useful in the treatment, monitoring and diagnosis of cancers, especially prostrate cancer. They can also be used to identify a substance that can associate with or mediate the biological activity of the proteins. Antibodies can be used to treat conditions mediated by the kallikrein-like proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New kallikrein-like (KLK-L) proteins for diagnosing and treating KLK-L protein mediated disorders, especially cancer. \dot{\cdot}

                                                                                                                                                                                                                                                                                          The present sequence is one of four alternatively spliced kallikrein-like proteins are accorded by the human KLK-L4 gene. Kallikreins and proteins are a subgroup of the serine protease enzyme family. They catalyse the selective cleavage of specific polypeptide precursors to release peptides with potent biological activity. Nucleic acids encoding kallikrein-like proteins KLK-L1, KLK-L2, KLK-L3, KLK-L4, KLK-L5 and KLK-L6 have been isolated. The proteins are useful in the treatment, monitoring and diagnosis of cancers, especially prostrate cancer. They can also be used to identify a substance that can associate with or madiate the biological activity of the proteins. Antibodies can be used to treat conditions mediated by the kallikrein-like proteins.
                                                                                                                                                                                                                                         New kallikrein-like (KLK-L) proteins for diagnosing and treating KLK-L protein mediated disorders, especially cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present invention describes an antibody that binds to a human protein (I) selected from: PRO381; PRO1269; PRO1410; PRO1755; PRO1780; PRO4344; PRO1567; PRO1567; PRO1269; PRO1410; PRO1755; PRO1780; PRO4344; PRO4567; PRO1567; PRO1269; PRO1262. (I) has anticancer activity and can be used to diagnose tumours in mammals, by detecting complex formation when the antibody is contacted with test cells. Increased expression of genes encoding (I) can also be detected to diagnose tumours. Agents which inhibit the activity of (I), especially the antibodies, or an antisense oligonucleotide which hybridises to genes encoding (I) can be used to inhibit tumour growth, preferably by inducing (I), can be used to inhibit the biological activity or can be used to identify compounds which inhibit the biological activity or of I). AACS8019 to AACS8012 represent PCR primers and hybridisation probes used in examples from the present invention for human PRO sequences. AACS8103 to AACS8121 and AAB24021 to AAB24040 represent human the present invention of the present invention of the present invention of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; PRO; promotion; inhibition; angiogenesis; cardiovascularisation; diagnosis; trauma; wound; cancer; atherosclerosis; cardiac hypertrophy; angiogenic; proliferative; cardiant; cardiovascular; antiatherosclerotic;
                                                                                                                                                                                                                           Antibodies specific for PRO polypeptides, used to diagnose and inhibit the growth of tumors in mammals, and to identify inhibitors of PRO polypeptide activity or expression -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes nucleic acids encoding PRO polypeptides useful for preventing, diagnosing and treating diagnosing a cardiovascular, endothelial or angiogenic disorder in mammals by modulating cell proliferation, angiogenesis and cardiovascularisation, and for identifying agonists and antagonists of these processes. The nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate PRO expression such as cardiovascular, endothelial or angiogenic disorders in mammals (e.g. atherosclerosis, cancers and cardiac hypettrophy). For example, the nucleic acids (NCs) and vectors containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a
encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primers and hybridisation probes used in the isolation of the PRO PRO PROPERTIALS from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present sequence is one of four alternatively spliced kallikrein-like proteins encoded by the human KLK-L4 gene. Kallikreins and aproteins are a subgroup of the serine protease enzyme family. They catalyse the selective cleavage of specific polypeptide precursors to release peptides with potent biological activity. Nucleic acids encoding kallikrein-like proteins KLK-L1, KLK-L2, KLK-L3, KLK-L3, KLK-L4, KLK-L5 and KLK-L6 have been isolated. The proteins are useful in the treatment, monitoring and diagnosis of cancers, especially prostrate anner. They can also be used to identify a substance that can associate with or mediate the biological activity of the proteins. Antibodies can be used to treat conditions mediated by the kallikrein-like proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New kallikrein-like (KLK-L) proteins for diagnosing and treating KLK-L protein mediated disorders, especially cancer. -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Serine protease; RNK Met-1; cytolytic granule; leukemia;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                           New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions - \,
                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Drosophila; developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A new 30 kDa serine protease, RNK Met-1, was isolated from the cytolytic granules of rat RNK-16 large granular lymphocyte leukemia cells. cDNA was obtained from a rat RNK-16 lambda-gill library and sequenced (AAQ66509). The mature protein (sequence AAR55757) has an N-proteases. The sequences given in AAR55761 found in activated serine proteases. The sequences given in AAR55762 and AAR5573 respectively include the active site His-41 and Ser-184 of RNK Met-1 and are also highly conserved. DAN encoding RNK Met-1 can be used as a probe to detect the enzyme in tumor biopsy samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New serine protease with Met-ase activity - isolated from lymphocyte granules, also related DNA vectors, transformed cells and antibodies.

                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to diagnosing cancer especially ovarian cancer, by
                                                                                                                                                                                                                               specification, but was obtained in electronic format directly from WIPO
                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                       stratum corneum chymotrypsin enzyme peptide #88 (residues 61-69).

                       considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            in vitro translation) method, for synthesizing polypeptides encoded by sequences of interest. The method generates a protein from an RNA molecule and comprises (a) incubating the RNA with reverse transcriptase to form cDNA; (b) amplifying the CDNA of Step (a) to generate DNA copies of the cDNA in the presence of at least 1 oligonucleotide primer which contains an RNA promoter sequence; (c) transcribing the DNA generated with an RNA polymerase to form RNA transcribts; and (d) translating the
for stratum corneum chymotrypsin enzyme (SCCE). Proteases are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel modified RAWIT (RNA amplification with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RNA transcripts in vitro to generate the protein. This sequence represents a fragment of the rabbit Factor IX protein which is used to illustrate the RAWTS (RNA amplification with transcript sequencing)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         polypeptides from nucleic acid sequences of interest using a RAWIT (RNA amplification with in vitro translation) method -
